Revolutionary CPOE Implementations with Plexina™ 2.0

Clinical Analysts can convert the Clinician's practice recommendation (bought or defined) into completely standardized and managed Order Sets in less than 30 hours.

Achieve High Clinical Adoption

Actual results:

91% residents
72% attendings
over 3 years
over 1700 clinicians

A successful CPOE system requires customization of order sets to align with the clinical environment. Whether purchasing pre-built order sets, or creating order sets from scratch, each order set must be tailored to comply with local formularies, utilize services and equipment available, implement organizational or departmental care policies, and refer to evidence. Well designed, evidence-based order sets deliver positive outcomes, gain clinician trust and promote clinician adoption of order sets and CPOE.

Manage Broad Standardization

Actual results:

2100 order sets
< 15 analysts
4 hospitals
over 20 depts
diverse types

High-quality order sets can deliver significant positive outcomes and can potentially be used in many clinical areas for many diverse disorders, diagnostic processes, common conveniences, or specific treatment protocols. Each order set undergoes stringent development, review, testing, and activation processes that involve a large multidisciplinary team. Managing change requests, development plans, clinician reviews, releases schedules, issues, changes, and EMR configuration is critical to building and maintaining a broad base of standardized order sets, and is all attainable with a revolutionary integrated solution from Wairever and Plexina™ 2.0.
